Saving work The main idea behind the file system is `_saving_` : That is, Photoshop wants you to save your work somewhere. But the best practice is to save work only in the special `_Photoshop Elements_` folder, as shown in Figure 3-1. This folder is always on your computer (you can even remove it if you want, but it's not required) and has a subfolder for each project you create. The main advantage of saving your work in the `_Photoshop Elements 3.0_` or `_Photoshop CS_` subfolders is that you won't overwrite any data on your hard drive (unlike if you save work in your regular user files). However, as a result, your final files are not easily portable; they are only stored in the most recent version of the operating system you have installed. Photoshop saves its work as a file that contains the image, plus additional information to tell you what type of file it is (Figure 3-2

Our objective is to study the determinants of language and cognitive development in early childhood. We have developed a computer-based language testing program that we will use in our studies of variation in the early language environment. Our hypothesis is that children benefit most from concurrent, interactive interaction with a parent in the course of learning language. Interactive language learning is thought to mediate the beneficial effects of early language stimulation. Additionally, we are investigating the development of semantic representations in infancy. If an early word categorization is in progress, studies will identify the developmental stage of conceptual knowledge and its relation to memory and other cognitive processes. The development of memory and problem solving abilities is being investigated at preverbal and verbal levels by measuring infants' abilities to learn and retrieve first and second order conditional rules, and to solve complex reasoning problems involving conditionals. Alteration of community structure after a multi-year drought on the soil fungal community in a tropical agroecosystem. The functional role of soil fungi in maintaining the structure of terrestrial ecosystems is poorly understood. We studied the effect of a multi-year drought on the structure of the soil fungal community in a tropical agroecosystem. After the drought, soil fungal communities in rainfed and irrigated systems had lower Shannon diversity (H')

and evenness ( $J'$ ) indices and fewer shared species than before the drought. The drought induced changes in the network profile of the soil fungal community. The relative abundance of certain taxa, such as Sordariomycetes, Chaetomiaceae, Polyporales, and \*Basidiomycetes,\* were higher in the drought stressed soil, while those of Pezizomycetes, Isolateomycetes, \*Trichoderma\*, \*Cylindrocarpon\* and Dothideomycetes were lower in drought stressed soil. We propose that the fluctuation of species and community structure of soil fungi during the drought may be due to the specific phenology of the soil organisms, resource heterogeneity, and the feedback between the drought and the fungal community.
